

Stat 9270 Homework 4 - Due Wednesday, April 30 at 5pm

This final homework is an open-ended project. Perform a Bayesian analysis on a dataset or data-motivated question of your choosing. Your project report should include the formulation of a model, the implementation of that model, and evaluation of your model.

You are required to submit a pdf document of your report to Canvas. Your submitted writeup must be generated using the LaTeX typesetting language and any included graphics should appear wherever they are referenced in your writeup. Do not just put all graphics at the end of the document!

Limit the writeup of your project to 6 single-spaced (and single-columned) pages using a 12pt font. That 6 page limit includes all graphics and references.

Please do all computational work using the software package R. Your R code must be included in your submission as a separate text file. Your R code does not count towards the 6 page limit. So your homework submission will consist of two files:

1. Your report in pdf format (created using LaTeX, 6 single-spaced and single-columned pages or less)
2. Your code in text format

No late homeworks will be accepted for any reason whatsoever. You should work independently of the other students in the class on each homework.
